

a getgitgirl free framework

the friends framework

a marketing team of six ai agents and one operator. what each one owns, how the work moves between them, and how to build your own — starting with one.

why a **team**, not one mega-prompt

the instinct is one enormous prompt that does everything. it holds for about a week, then falls apart. here's why, and what to do instead.

what goes wrong

a single agent asked to research, write, design and send has no focus. its context fills with unrelated detail, its instructions compete, and it averages every task instead of nailing one. when the output is off, you can't tell which part broke.

the fix: one agent, one job

give each function its own agent — its own instructions, its own tools, its own definition of done. small scope buys you sharp output and a single obvious failure point you can actually fix.

the floor manager

the specialists never message each other. one operator takes the output of one and briefs the next. it's a team with a floor manager, not a group chat talking itself in circles.

why friends

six named roles you already understand. ross digs things up, monica runs the room. it makes an abstract system easy to hold in your head, and easy to explain to a client.

your marketing team, rebuilt as **six** ai agents

03

one sitcom. six specialists, one job each. one operator holding it together.

the idea

one agent = one job. never a “do everything” agent — they get vague and go wrong. the specialists never talk to each other directly; the operator routes every hand-off. it’s a team with a floor manager, not a group chat.

the team

01 **ross** · **research**

finds the signal — who to target, what’s moving in your space, what competitors just shipped. seo and aeo audits, keyword and competitor intel.

02 **phoebe** · **strategy**

turns that signal into angles, positioning and the brief. the blue-sky ideas and the contrarian takes that stop the scroll.

03 **chandler** · **copy**

scripts, captions, carousels, emails, landing pages — then a voice pass so none of it reads like ai wrote it.

04 **rachel** · **design**

visual identity, carousel and asset design, the premium look. art-directs everything chandler writes.

05 **joey** · **outreach**

the pitch, the cold approach, the proposal, and the video / ugc. warms a stranger into a booked call.

06 **monica** · **ops + dms**

sends the deliverables, runs the schedule, answers dms, qa’s the work, keeps every claim compliant and honest.

+ **hermes** · **the operator**

not a specialist. routes every hand-off between the six, runs the schedule, and sends you one plain brief a day.

ross

research

the one who finds the signal.

owns

everything upstream of a decision — who your buyers are and where they gather, what's moving in your category this week, what competitors just shipped or changed. the raw material every other agent works from.

takes in · hands off

in — your market, your competitors, and a fixed watch-list of accounts and keywords.

out — a short signal brief. five to ten things worth reacting to, ranked, with links.

works with

a scraper for social and news, a search layer for the open web, and a list of sources you actually trust. runs on a schedule, not on demand.

good looks like

you open the brief and know what to make this week. nothing in it is more than a few days old.

the one rule

ross reports, ross doesn't decide. no angles, no opinions — that's phoebe's job.

phoebe

strategy

the one who decides what's worth saying.

owns

turning raw signal into a point of view — the angle, the positioning, the hook, and the brief everyone downstream builds from. also the contrarian take nobody else in the room will say out loud.

takes in · hands off

in — ross's signal brief, plus your positioning and your goals for the quarter.

out — a one-page brief per piece — the claim, who it's for, the angle, the format, the proof it needs.

works with

your positioning doc, your past performance data, and a model good enough to argue back. this is a thinking job, not a lookup — give it your best one.

good looks like

chandler can execute the brief without asking a single follow-up question.

the one rule

one claim per brief. a brief that says three things produces content that says nothing.

chandler

copy

the one who writes it so it doesn't sound like a robot.

owns

every word that ships — scripts, captions, carousels, emails, landing pages — plus the final voice pass that strips the ai tells back out.

takes in · hands off

in — phoebe's brief, your voice guide, and examples of your best past work.

out — a finished draft, plus a flagged list of anything it wasn't sure about.

works with

a voice guide reverse-engineered from your own writing, a list of your banned phrases, and a second lower-temperature pass for the edit.

good looks like

you'd post it with light edits, not a rewrite. no “dive in”, no “in a world where”, no pile-up of dashes.

the one rule

chandler drafts, a human posts. nothing ships without your eyes on it.

rachel

design

the one who makes it look expensive.

owns

the visual identity and every asset that carries it — carousels, thumbnails, one-pagers, the deck, the freebie. plus art direction: briefing the look before anything gets made.

takes in · hands off

in — chandler's copy, plus your brand system — colour, type, spacing, the rules.

out — laid-out assets in your template, export-ready and on-system.

works with

a locked design system it can't deviate from, a component or template file, and a reference folder of work you'd kill for.

good looks like

it looks like one brand made it, not a template someone filled in. people screenshot it without the caption.

the one rule

the system is not a suggestion. new colour, new font, new layout — it stops and asks.

joey

outreach

the one who turns a stranger into a booked call.

owns

everything pointed at one specific person — the cold open, the follow-up sequence, the proposal, the pitch. plus the talking-head and ugc video that warms them up first.

takes in · hands off

in — ross's list of who to target, plus your offer and your proof.

out — a personalised approach per prospect, and a proposal on request. never a mail-merge.

works with

a crm or a simple tracked list, your case studies and results, and a video tool for the warm-up. sends through a real inbox, not a blast tool.

good looks like

the prospect replies as if a person wrote it, because the specifics are real.

the one rule

personalised or it doesn't send. if joey can't name something true about this person, there's no message.

monica

ops + dms

the one who runs the room and keeps it honest.

owns

everything after “made” — sending deliverables, the posting schedule, replies to dms and comments, qa on every piece, and the compliance check: does this claim actually hold up.

takes in · hands off

in — finished work from chandler and rachel, plus your calendar and your rules.

out — scheduled posts, sent deliverables, answered dms, and a flag on anything that fails qa.

works with

a scheduler, your dm platform, a qa checklist, and a compliance rule-set for your industry. the last gate before the audience.

good looks like

nothing ships late, nothing ships wrong, and no dm sits unanswered for a day.

the one rule

monica can hold a post, never rewrite one. a failed check goes back to the author.

hermes

10

the operator

not a specialist. the one who moves work between the other six.

what it does

takes the output of one agent and briefs the next. runs every agent on its schedule. tracks what each task costs. sends you one plain brief a day: what ran, what's waiting on you, what broke.

the daily brief

the most useful thing in the system. three lines — done, waiting on you, needs a decision. you run the team from that, not from six dashboards.

cost control

hermes picks the model per task. a scrape-and-summarise runs on something cheap. phoebe's strategy call runs on your best one. you set the rule once.

the schedule

ross at 6am. phoebe reads the brief at 8. chandler drafts by 10. it's in your approval queue by lunch. you're a gate, not a bottleneck.

the one rule

hermes routes and reports. it never writes, designs or decides. the moment the operator starts doing the work, you're back to one mega-agent.

the **three** files every agent loads first

before an agent touches a task it reads the same three things, in this order. this is what makes the output yours and not generic.

1 · rules

what it must never do. brand non-negotiables, legal and compliance limits, tone bans, the actions that always need a human. one file, shared by every agent. write it once.

2 · context

who you are, who you serve, what you sell, what makes you different. the brief a new hire gets on day one. this is why the output sounds like your business and not a template.

3 · the task skill

the actual how-to for this one job. ross's research method. chandler's voice rules. rachel's layout system. one per agent — and the only file that changes between them.

rules and context are shared. the task skill is the specialism. that's the whole pattern.

how the work moves

12

three flows. every arrow runs through hermes — the agents never hand to each other directly.

content

ross → **phoebe** → **chandler + rachel** → **monica**

signal becomes an angle becomes a draft becomes a scheduled post.

leads

ross → **chandler + rachel** → **joey** → **monica**

a name becomes a warm contact becomes a pitch becomes a booked call.

inbound

monica → **joey**

every dm gets triaged. real enquiries go to joey, the rest get logged.

draw this on paper before you build anything. if you can't draw the arrows, the roles aren't clear enough yet.

don't build six. build **one**.

13

a six-agent team you spin up in a weekend is a six-agent mess by monday. build it in this order.

01 · start with the job that's most on fire

the one eating your week — usually chandler (writing) or ross (research). build that agent alone, with its three files. use it for two weeks before anything else.

02 · add a second, and a written hand-off

now you feel the seam. write down exactly what agent one produces and agent two expects. that hand-off spec matters more than either agent.

03 · at three agents, add hermes

three is where manual routing breaks. bring in the operator and the daily brief. not before — an operator with nothing to route is just overhead.

04 · add the rest only when the last one is boring

if an agent still surprises you, it isn't finished. a finished agent is predictable. add the next when the current one has stopped needing you.

most people need three. six is a full agency. build to your actual workload.

define your first agent

fill this in for the one job that's most on fire. keep it to one page — if it needs two, the scope is too big.

```
agent      - name (borrow a friend)
owns       - the one job, in one sentence
takes in   - what it gets, and from where
hands off  - what it makes, and to whom
tools      - the two or three it actually needs
good =     - one line: how you know it's right
never      - 2-3 limits it must stop and ask about
loads      - rules.md → context.md → this-skill.md
```

write it in plain language. if you can't explain the job to a smart friend in three sentences, the agent can't do it either.

five ways it goes wrong

15

the ones that show up again and again. each is cheap to avoid and expensive to unpick.

01 · agent sprawl

one agent per passing idea. you end up with twelve half-built bots and no system. cap the count. merge anything that overlaps.

02 · no rules file

skipping governance because it's boring. then an agent makes a claim you can't back, in your name. write the rules before the incident, not after.

03 · agents talking to each other

letting agent a call agent b directly. a failure in one now cascades and you can't trace it. every hand-off goes through the operator, and gets logged.

04 · no human gate

full auto on anything that publishes or sends. speed you didn't need, risk you can't see. a person approves anything with your name or face on it.

05 · one model for everything

cheap tasks on your best model, or judgement calls on your cheapest. match the model to the job — it's most of your cost and most of your quality.

none of these are ai problems. they're org-design problems. build the team like a team.

start here

this week. not someday.

16

step 01

name the job that's costing you the most hours. just that one.

step 02

write its role template — the one on page 14. one page, plain language.

step 03

build it with its three files. run it for two weeks before you add a second.

the whole method

one agent, three files, a human gate. the team comes later — or never, if one is enough.
