

* a getgitgirl free framework

the friends framework

six ai agents run a marketing function between them — one per friends character. what each one does, how the work passes between them, and how to build it without it turning into a mess.

17 pages · the files are on github · built with claude
@getgitgirl

why a **team**, not one mega-prompt

most people start with one giant prompt. research this, write that, in my voice, and post it. it holds up for about a week.

what breaks

the prompt gets long. rules for writing sit next to rules for research and start contradicting each other. the context fills with things that mattered three tasks ago. and when a post comes out wrong you're scrolling 600 lines to find where.

split it by job

each function gets its own agent, its own short instruction file, its own two or three tools. an agent that only researches is easy to write and easy to fix, because there's only one thing it can get wrong.

one operator in the middle

the agents don't call each other. hermes takes what ross found and hands it to phoebe with a brief. if any agent could trigger any other, one bad output would set off four more and you'd never find the first.

the friends names earn their keep

you remember what ross does without opening a diagram. he digs stuff up. monica runs the room. chandler complains but he can write.

the six, plus hermes and gunther

one job each. screenshot this — the rest of the guide is a page per agent.

one agent, one job. they don't talk to each other — hermes moves the work between them, gunther watches that it's moving.

ross · research

who to target, what got shared this week, what a competitor just changed. the reading everyone skips.

phoebe · strategy

picks what's worth saying and writes the brief. the one who'll push for the riskier angle.

chandler · copy

writes everything that goes out, then rewrites it so it stops sounding like a template.

rachel · design

makes it look like money. carousels, thumbnails, the deck, this pdf.

joey · outreach

cold messages, follow-ups, proposals, the warm-up video. gets a stranger onto a call.

monica · ops + dms

posts on schedule, answers dms, checks every claim. the last one to touch it.

hermes · the operator

passes work between the six, runs the timers, sends you one message a day with what needs you.

gunther · the watchdog

watches that the work is actually happening. pings you the second something stalls or the spend spikes.

ross

research

04

the research seat. everyone downstream starts from what ross found, not from a guess.

owns

the reading. your buyers and where they spend time. what's getting traction in your niche this week. anything a competitor shipped, repriced, or pulled.

in · out

in — a list of accounts and search terms to watch, plus who you're trying to reach.

out — a short brief, daily or weekly. five to ten items, ranked, links attached.

works with

a scraper (apify, phantombuster, take your pick), a web search tool, and a fixed source list. it runs on a timer. you don't prompt it.

done when

you read the brief in two minutes and know what to make. nothing in it is older than a few days.

the one rule

ross finds things and links them. the “so what” is phoebe's call, not ross's.

phoebe

strategy

decides what's worth saying, then writes the brief so chandler isn't guessing.

owns

the angle. the claim you're making, who it's for, why now. and the takes most people sit on.

in · out

in — ross's brief, your positioning, what you're selling this quarter.

out — one brief per piece. a paragraph, not a form.

works with

your positioning doc, whatever performance data you have, and your best model. a cheap model shows here more than anywhere.

done when

chandler reads the brief and starts writing. no follow-up questions.

the one rule

one claim per brief. put three in and the post says nothing.

chandler

copy

writes it — captions, scripts, emails, pages. then edits the ai back out.

owns

every word that ships. and the second pass, where it stops sounding like a press release.

in · out

in — phoebe's brief, your voice guide, five things you've written that you'd post again.

out — a draft, plus a note on anything it wasn't sure about.

works with

a voice guide built from your actual posts, not a description of your voice. a banned-words list. a lower-temperature pass for the edit.

done when

you change a few words and post it. you don't rewrite it.

the one rule

chandler never hits publish. a person does.

rachel

design

makes it look expensive, and stops chandler shipping a wall of text.

owns

the look, and every asset carrying it. carousels, thumbnails, the deck, the pdf you're reading.

in · out

in — the copy, plus your design system: colours, fonts, spacing, the rules.

out — laid-out files in your template, ready to export.

works with

a design system it can't wander off, a template file, and a folder of work you wish you'd made.

done when

it looks like one person made everything. someone screenshots it without the caption.

the one rule

the system isn't a starting point. new colour or font, it stops and asks.

joey

outreach

08

turns a name on a list into a call in the calendar.

owns

everything aimed at one person. the first message, the follow-ups, the proposal. and the warm-up video that goes out first.

in · out

in — ross's list of who, plus your offer and proof.

out — a message written for that person. not a template with a first-name field.

works with

a crm or a spreadsheet, your case studies, a video tool for the warm-up. it sends from a real inbox.

done when

they reply like a person wrote it, because the details are real.

the one rule

no true, specific detail about this person means no message goes out.

monica

ops + dms

the last one to touch anything before the audience sees it.

owns

posting, scheduling, dms, comments, and the check on every claim — can you back this up.

in · out

in — finished work from chandler and rachel, your calendar, your rules.

out — posts scheduled, dms answered, a flag on anything that doesn't pass.

works with

a scheduler, your dm tool, a qa checklist, the compliance rules for your field.

done when

nothing's late, nothing's wrong, and no dm sits for a day.

the one rule

monica can hold a post. monica can't rewrite one — that goes back to whoever wrote it.

hermes

the operator

10

the one agent that doesn't make anything. it moves work and watches the clock.

what it does

takes ross's brief to phoebe, phoebe's to chandler. runs each agent on its schedule. logs what every run costs. once a day, it messages you.

the daily message

three lines. done, waiting on you, needs a call. you run the whole thing off that.

picking the model

hermes chooses per task. a summary runs on something cheap. phoebe's call runs on the expensive one. you write that rule once.

the schedule

ross at 6, phoebe at 8, chandler by 10. it's in your approval queue by lunch.

the one rule

hermes routes and reports. it doesn't write, design or decide. the day it starts doing the work, you've rebuilt the mega-prompt.

gunther

the watchdog

11

doesn't touch the work. watches that the work is happening.

what it watches

did ross's brief land this morning. is anything stuck in a queue. has an agent stopped responding. is today's spend three times a normal day.

the alert

when something's off, gunther messages you before you'd have noticed. no dashboard you have to remember to open.

what it can do

pause a run, retry a failed step, or hold the whole line until you look. it stops things. it doesn't fix them.

why it isn't hermes

hermes runs the plan. gunther checks the plan is still running. you want the thing raising alarms to not be the thing that might be broken.

the one rule

gunther raises the alarm. what to do about it is your call, not gunther's.

the **three** files every agent loads first

every agent reads these before it starts, in order. it's what keeps the output from sounding generic.

1 · rules

what no agent is allowed to do. brand lines you don't cross, legal limits, the actions that always need a person. one file, every agent loads it. write it before you build anything.

2 · context

who you are, who you sell to, what you sell, why someone picks you. what you'd tell a new hire on day one. this is why chandler sounds like your company.

3 · the task file

how to do this one job. ross's sources and method. chandler's voice rules. one per agent, and the only file that changes between them.

same rules, same context, a different task file. that's every agent on the team.

how the work moves

three routes through the team. every arrow is hermes handing off — the agents don't pass to each other.

content

a signal becomes an angle, a draft, a scheduled post.

leads

a name becomes a warm lead, a pitch, a booked call.

inbound

monica reads every dm. real enquiries go to joey. the rest she logs.

if you can't draw these arrows for your own team, the roles aren't clear enough. draw them first.

don't build six. build one.

six agents set up in a weekend is six things breaking on monday. do it in this order.

01 · start with whatever's eating your week

for most people that's chandler or ross. build one agent, give it the three files, use it for two weeks. don't touch anything else.

02 · add the second, and write the hand-off down

now you can feel the join. write exactly what agent one produces and what agent two expects. that spec is more work than either agent, and it matters more.

03 · at three agents, bring in hermes

three is where doing the routing yourself stops being free. add the operator and the daily message. earlier and it's just another thing to maintain.

04 · add the rest when the last one got boring

if an agent still surprises you, it isn't finished. add the next when the current one has stopped needing you.

most people stop at three. six is a whole agency. build for the work you have.

define your first agent

fill this in for the job you picked. one page. if it runs to two, the job's too big — split it.

```
agent      - name (steal one from friends)
owns       - one job. one sentence.
takes in   - what it gets, and who from
hands off  - what it makes, and who to
tools      - the two or three it needs. no more.
done when  - one line: how you know it's right
never      - the 2 or 3 things it stops and asks about
loads      - rules.md → context.md → this-file.md
```

if you can't explain the job to a friend in three sentences, the agent won't get it either. plain words.

five ways it goes wrong

the ones that show up over and over. all cheap to avoid up front, all a pain to fix later.

01 · too many agents

a new one every time you have an idea. now there are twelve half-built and no system. pick a number, merge anything that overlaps.

02 · no rules file

skipped because it's the boring part. then an agent says something you can't back, in your name. rules go first, not after it happens.

03 · agents calling agents

one agent triggering another directly. one break becomes five and you can't find the first. everything through hermes, logged.

04 · full auto on publish

no person on anything that posts or sends. you saved thirty seconds and took a risk you can't see. someone signs off on anything with your name on it.

05 · one model for the team

your best model on a scrape summary, or your cheapest on a strategy call. the model choice is most of your bill and most of your quality.

start here

this week.

step 01

name the job costing you the most hours. one job.

step 02

fill in the template on page 15. one page, plain words.

step 03

build it with its three files. run it two weeks before you add a second.

the whole thing

one agent, three files, a person on the publish button. add the rest later, or don't.
